

ACQUISITION RISK · REVIEW-PRIORITY PROTOTYPE

Find the contracts that need a funding review — before they expire.

A prioritized, explained review queue for a federal acquisition team: from governed data to a natural-language interface to an operational cockpit where a manager acts.

Snapshot · 2026-09-23 48 synthetic contracts Fully synthetic data

The score is a transparent review priority — not a risk probability or legal determination. A person makes every contracting decision.

THE BUSINESS OUTCOME

Reduce the manual effort to find the contracts that need financial or administrative attention before they expire — and shorten the time from **flagged to **assigned for review**.**

A governed pipeline, an explained review queue, a natural-language interface, and an operational cockpit — every component serves this one outcome.

THE MONDAY-MORNING DECISION

Two funding patterns quietly create risk.

UNDERUTILIZATION

Money left on the table

A contract nears expiration with substantial obligated funds still unspent.

FUNDING EXHAUSTION

Running out early

Recent spending pace will exhaust the remaining obligation before the period of performance ends.

Today, answering “*which contracts do I look at this week?*” means stitching together awards, obligations, dates, and spend trends by hand — for every contract, every week.

THIS SNAPSHOT · 48 CONTRACTS

24 High priority for review	\$30.6M Obligated funds that may go unspent	~\$16M Projected funding shortfall before expiration	50% Of the portfolio flagged this week
Possible funding exhaustion 12 contracts · spending will outrun the balance			~\$15.98M projected shortfall
Possible underutilization 12 contracts · funds may expire unspent			\$30.60M remaining obligations
Watch 12 contracts · approaching expiration			Monitor no high-priority rule
Routine 12 contracts			Clear no rule triggered

Amounts are triage signals over synthetic records — not measured savings, losses, or a recommendation to deobligate funds.

Cockpit app

The manager's one screen

Analytics determines the priority. **AI** explains it. **A person** decides.

What we'll walk through.

1 Overview

“24 of my 48 contracts are high priority; \$30.6M may go unspent, ~\$16M may fall short.”

2 Open the top item

Obligation, remaining balance, burn, days to expiration — and a plain-language brief of *why*.

3 Ask Genie

“Which contracts expire within 60 days with more than \$1M remaining?” → 11 contracts, with SQL and rows.

4 Assign it

Set owner, status, and a note — it persists and appears in the queue's Stage column.

VALUE · EXECUTIVE SPONSOR

The person who funds the decision.

Portfolio visibility How many contracts merit attention this snapshot, and the dollars in each review category.

Throughput Are reviews assigned and closed *before* expiration — not after.

Governance Data governed centrally; the app exposes only what acquisition users need, with least-privilege access and full lineage.

Pilot KPIs: [share reviewed before expiration](#) · [median time from flag → assignment](#) · [staff hours on the weekly queue](#).

VALUE · ACQUISITION MANAGER

The domain owner who lives in the tool.

A ranked queue Starts with prioritized work, not a blank spreadsheet.

The “why” Exact dates, balances, burn, and the rule that fired — a defensible flag.

Ownership Records who owns the next step; filters by stage to return to in-progress work.

Plain language Asks questions of the data without writing SQL.

WHY THIS IS A RESPONSIBLE USE OF AI

- 01 **Deterministic rules set the priority.** Transparent thresholds on dates, remaining obligation, and projected spend — no mysterious probability.
- 02 **AI only explains.** The brief restates the contract's own figures; it never asserts fraud, noncompliance, or that funds should be deobligated.
- 03 **Governed and synthetic.** One Unity Catalog schema, table lineage, least-privilege grants; every record is generated, not sourced from USAspending, SAM, or GSA.
- 04 **Human in the loop.** A high-priority item means *review the funding plan* — not act automatically.

RESPONSIBLE NEXT STEP

The prototype establishes the workflow.

- 01 **Validate the definitions** — obligation vs. expenditure, the burn window — with finance and contracting staff.
- 02 **Connect an authorized expenditure feed** in place of the synthetic ledger.
- 03 **Tune the thresholds** against historical review outcomes.
- 04 **Run a time-boxed pilot** and measure the KPIs.

Keep human approval for any funding or contract action. Any time-savings figure is an estimate until measured against a baseline.

LIVE DEMO

Let's open the cockpit.

It's Monday morning. I'm an acquisition manager with 48 contracts — and I need to know which ones require my attention.
